Question 2

If we want to set a file named"file_B"

owner have all Permission

group member can read and write

other user can only execute it

What command should we use?

sudo chmod 761 file_B

Create folder called "share" and change its Permission, let the user above (Q1) access this folder. (show your step)

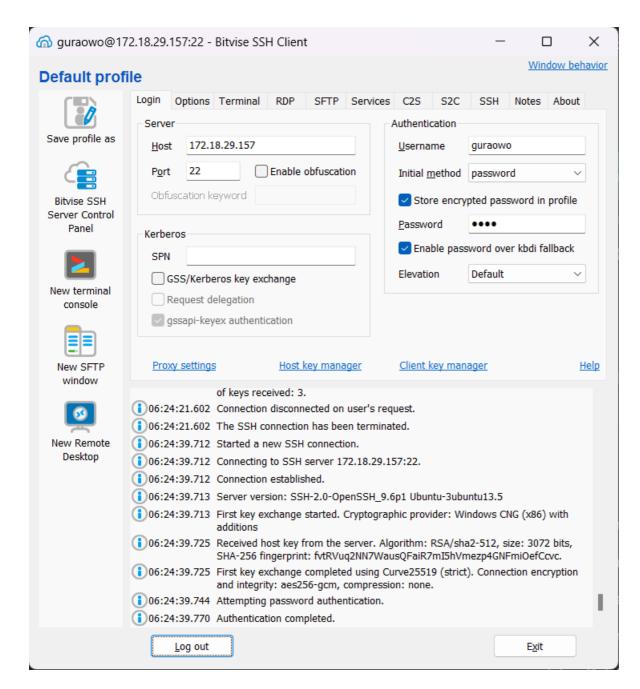

```
guraowo@Cyborg15: /share
whitebear13579@Cyborg15:~$ cd /
whitebear13579@Cyborg15:/$ sudo mkdir share
whitebear13579@Cyborg15:/$ ls
Docker
                                                               proc sbin
                     boot home
                                  lib.usr-is-merged
                                                       media
                                                                                                    tmp
                                                                                             snap
bin
                     dev
                           init
                                  lib64
                                                               root sbin.usr-is-merged
                                                                                                   usr
                                                                                             srv
                           lib
                                  lost+found
bin.usr-is-merged etc
                                                               run
                                                                      share
                                                                                                   var
                                                                                             sys
whitebear13579@Cyborg15:/$ sudo chmod 777 share

```

Question 4

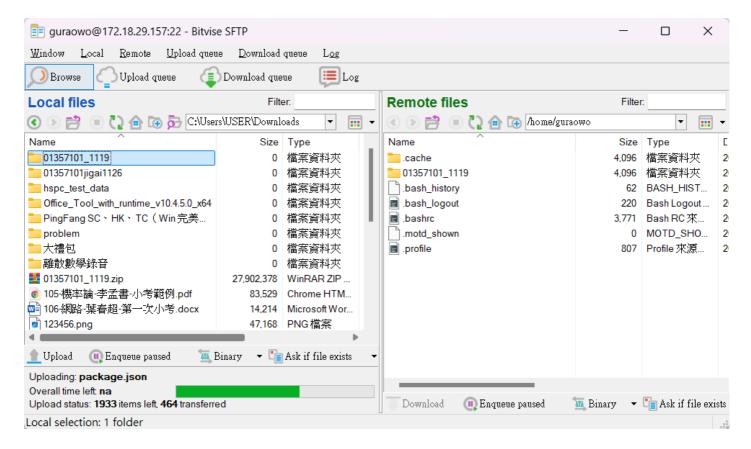

Connect to your Ubuntu server with bitvise

```
Installing SSH
whitebear13579@Cyborg15:~$ sudo apt install ssh
Reading package lists... Done
Building dependency tree... Done
Reading state information... Done
ssh is already the newest version (1:9.6p1-3ubuntu13.5).
0 upgraded, 0 newly installed, 0 to remove and 3 not upgraded.
whitebear13579@Cyborg15:~$ sudo service ssh start
whitebear13579@Cyborg15:~$ service ssh status
 ssh.service - OpenBSD Secure Shell server
     Loaded: loaded (/usr/lib/systemd/system/ssh.service; disabled; preset: enabled)
Active: active (running) since Tue 2024-12-10 14:20:23 CST; 6s ago
TriggeredBy: • ssh.socket
       Docs: man:sshd(8)
             man:sshd_config(5)
    Process: 1213 ExecStartPre=/usr/sbin/sshd -t (code=exited, status=0/SUCCESS)
   Main PID: 1215 (sshd)
      Tasks: 1 (limit: 9348)
     Memory: 2.1M ()
     CGroup: /system.slice/ssh.service
             Li215 "sshd: /usr/sbin/sshd -D [listener] 0 of 10-100 startups"
Dec 10 14:20:23 Cyborg15 systemd[1]: Starting ssh.service - OpenBSD Secure Shell server...
Dec 10 14:20:23 Cyborg15 sshd[1215]: Server listening on :: port 22.
Dec 10 14:20:23 Cyborg15 systemd[1]: Started ssh.service - OpenBSD Secure Shell server.
whitebear13579@Cyborg15:~$
```

Use bitvise to connect ubuntu server

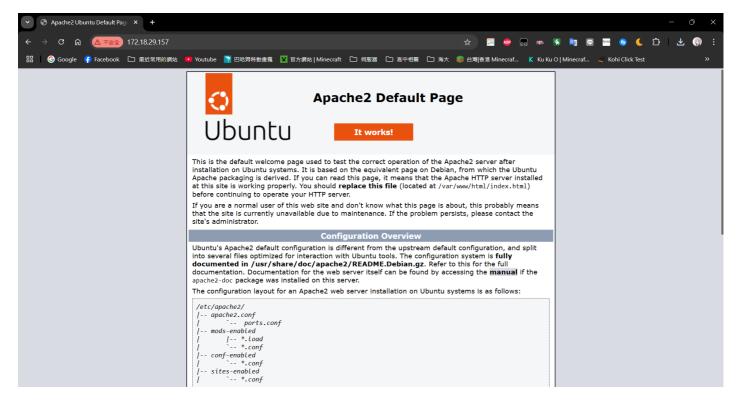

Send your html (week 9 or 10 Lab) to your Ubuntu server.

Activate the apache2 then connect to default web with the browser inside the Ubuntu.

```
啟動 Apache2 Server
    whitebear13579@Cyborg15: ~ ×
whitebear13579@Cyborg15:~$ sudo apt install apache2
Reading package lists... Done
Building dependency tree... Done
Reading state information... Done
apache2 is already the newest version (2.4.58-1ubuntu8.5).
O upgraded, O newly installed, O to remove and 3 not upgraded.
whitebear13579@Cyborg15:~$ service apache2 start
==== AUTHENTICATING FOR org.freedesktop.systemd1.manage-units ====
Authentication is required to start 'apache2.service'.
Authenticating as: ,,, (whitebear13579)
Password:
==== AUTHENTICATION COMPLETE ====
whitebear13579@Cyborg15:~$
                                                                        瀏譼
